Based on the conversation at the last CAST meeting on the study evaluation and selection table and the rationale that it was excluded because the study authors only tested 3 dose groups, I was leaning towards advancing Sarsilmaz. Have you consulted with Karen Hogan and/or John Fox? The endpoint seems valid and based on the table the other attributes of the study lead me to believe it was adequate for dose-response. Just my two cents though, I'd be eager to hear what others have to say.

Andrew,
Here are my comments on the FA neurotox section. I did not really have the time to dig into this, but hopefully my brief comments are helpful. Let me know if you have any questions.
Jamie

Hello formaldehyde CAST team,

I just wanted to follow up on the emails from Barbara below, regarding comments on the neurotoxicity section and the CAST presentation by July 10th (last Tuesday).

I realize that you are all extremely busy, so a few focused comments and guidance is all I need (see below) to improve this section considerably and keep it moving forward; however, any and all comments are welcome, of course.

Thank you, Jason, for already providing your comments- feel free to disregard this message.

Best,
-Andrew

I want to follow up on a couple of items from our CAST meeting last week. I know that Dave will be sending minutes of the meeting but I don't want you to forget that you committed to providing Andrew with your feedback by July 10th.

Andrew asked for your thoughts on the draft mode of action section and also to weigh in on whether the assessment should include an RfC for neurotoxicity based on effects on pyramidal cells in the hippocampus (see attached paper). Figure 6 at PND 30 would be the endpoint Andrew would suggest deriving a cRfC from, if we were to do so.

Finally, we would like to confirm that the CAST agrees that the hazard section should convey that these are serious effects even if the database has uncertainties and therefore we conclude that the evidence is suggestive.

Regards, Barbara
